

If You Make a Mistake...

If, during a programming session, you find that you are unsure of the scanner's settings or wish to reset the scanner's configuration, use the Return to Factory Settings label below to return the scanner's configuration to the factory settings. Scanning this label will also reset any changes made during previous programming sessions.

Return to Factory Settings

Scan the bar code below to return the scanner to the default settings configured at the factory for the currently active interface. This bar code is typically used to return the scanner to a "known" operating state when the present programming status is not known, faulty, or suspect.

CAUTION: Use this bar code with caution, since it will reset ALL features that may have been programmed since the scanner's installation.

NOTE: DO NOT scan the Enter/Exit Programming Mode bar code before and after scanning this bar code.
